excerpt from a new method with geography illustrating the use of the sketch map there has in recent year been much discussion on the subject of map drawing as an aid in the study of geography and while many good teachers strongly advocate it some equally good teachers as strongly oppose it the opposition is founded mainly on the fact that it takes up too much valuable time and who will say that this objection is not well taken pupils have been encouraged to spend weeks in the mechanical construction of maps into whose real meaning and relative proportions they took but little trouble to inquire but rather spent their time in tracing outlines and coloring surfaces according to some model usually the map in the book which lay before them this mechanical accuracy of copying is in itself not a bad thing but it does not develop the faculty of location nor teach the pupil anything about geography to draw maps according to some cartographic diagram or design is to defeat the object intended to be gained and hence many of our best teachers have warred against map drawing the sketching of maps from memory at once sets aside these objections and retains all that is favorable this exercise when rightly conducted is a most valuable aid and the following lessons have been arranged to assist teachers and pupils in its execution the pupils should take their places at the black board and at the direction of the teacher draw the boundary lines drawing the same lines at the same time in this way the outline may be discussed and criticised at different points and its accuracy determined from their memory of positions and relative proportions mountains rivers and lakes should then be sketched and discussed as to their location trend and extent the capitals and other important cities should then be located about the publisher forgotten books publishes hundreds of thousands of rare and classic books find more at forgottenbooks.com this book is a reproduction of an important historical work forgotten books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy in rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition we do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works

we need new maps is the central claim made in this book in a world increasingly influenced by human action and interaction we still rely heavily on mapping techniques that were invented to discover unknown places and explore our physical environment although the traditional concept of a map is currently being revived in digital environments the underlying mapping approaches are not capable of making the complexity of human environment relationships fully comprehensible starting from how people can be put on the map in new ways this book outlines the development of a novel technique that stretches a map according to quantitative data such as population the new maps are called gridded cartograms as the method is based on a grid onto which a density equalising cartogram technique is applied the underlying grid ensures the preservation of an accurate geographic reference to the real world it allows the gridded cartograms to be used as basemaps onto which other information can be mapped this applies to any geographic information from the human and physical environment as demonstrated through the examples presented in this book the new maps are not limited to showing population as a defining element for the transformation but can show any quantitative geospatial data such as wealth rainfall or even the environmental conditions of the oceans the new maps also work at various scales from a global perspective down to the scale of urban environments the gridded cartogram technique is proposed as a new global and local map projection that is a viable and versatile alternative to other conventional map projections the maps based on this technique open up a wide range of potential new applications to rediscover the diverse geographies of the world they have the potential to allow us to gain new perspectives through detailed cartographic depictions
